

COMPUTER RISK MANAGEMENT, INC.

## **Computer Risk Management Releases Risk2009™**

**Oklahoma City, OK, October 15, 2008** – Computer Risk Management (CRM) a provider of claims and risk management software today announced the release of Risk2009™, an upgraded version of its leading claims management software.

Risk2009™ includes a major upgrade in the reporting capabilities of the system. Ad hoc reporting functionality is provided through a new Business Intelligence module built on the Oracle Business Intelligence Enterprise Suite. “Our Risk series of claims software incorporates a sophisticated data base structure which has streamlined the administration of claims for many years”, said John Sullivan, President of Computer Risk Management. “The addition of the Business Intelligence module allows users to easily understand that data through powerful reports and analytics. We believe this enhancement will further help our clients drive down their claims costs,” added Sullivan.

Other enhancements in the Risk2009™ release include an upgrade in the underlying database and the unbundling of the claims management functionality. “The Risk series has a unique occurrence structure allowing for the management of multiple claims related to a single event. It also provides a balanced approach to managing different types of claim. However some of our clients are only self-insured for a single line of coverage. Unbundling gives them a cost effective solution focused on their specific needs” said Ty Smith, VP of Sales and Marketing.

### **About Computer Risk Management (CRM)**

CRM is a software provider to the claims and risk management industries. Its products are used by organizations to internally manage claims and control the costs of self-insured risks.
